Title of the Project: QuickRoute

Topic of the Project: Customers create an order and the nearest courier person confirms the order and places the order regardless of time.

Aim of the Project: In this system, it is enough to be registered on the site to be a courier, customers can order products or services at any time. Orders are offered to the nearest available courier based on the customer's location. Couriers can accept orders they want. In this way, we bring together people who do not have an engine, who are not affiliated with a large company, and who want to earn additional income, with people who need courier.

Delivery of orders is carried out by couriers quickly and efficiently. Then they begin the process of collecting and delivering the product or service. This way, customers' orders are prepared and delivered quickly.

The system makes it possible for customers to know in advance where their orders are and when they will be delivered. Couriers' locations and travel times can be tracked by customers. In this way, customers can plan their time more efficiently by knowing in advance when their orders will be delivered.
